Unit 4 · Session 7 · SLO 2 — Solved Worksheet

Name: SHAAYEQ PARVEZ SHAAYEQ PARVEZ | Reg. No: RA2511030010090

Unit “ 4 : Session “ 7 : SLO “ 2 | Execute Parallel Tasks with Process Pools

■ I. Programming Task

- from multiprocessing import Pool
-
- def cube(x):
- return x ** 3
-
- if __name__ == "__main__":
- with Pool(3) as p:
- print(p.map(cube, [1, 2, 3])) # [1, 8, 27]

■ II. Explanation

- Pool(3) creates three worker processes; map() sends each number to a worker and collects the cubes.
- The __main__ guard is required so child processes (spawned/forked) do not re-run the pool creation code.
- Output: [1, 8, 27] “ computed in parallel across the worker processes.
